Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is the protein sequence of rabbit histidine proline rich glycoprotein (HPRG), a proteinaceous chelator that can be used to inhibit anglogenesis and treat cancer. Claimed anti-anglogenic

```
CC doubties or peptides comprise: the histidine-proline-rich (H/P) donain (see ABB78806) of human HPRG; an H/P domain of rabbit HPRG (see ABB78017); a variant of these that is capable of inhibiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB7808. Also claimed are: chemically synthesised or recombinantly produced another; a diagnostically synthesised or recombinantly produced another; and agnostically synthesised or recombinantly produced anotypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the H/P domain of specific for an epitope of HPRG that is present in the H/P domain of specific for an epitope of HPRG that is present in the H/P domain or away which inhibits the anti-angiogenic activity of HPRG or the domain. Or an antigen-binding fragment of the antibody a method for treating a subject having a disease or condition associated with undesired cell migration, or angiogenesis; a method of stimulating or inhibiting cell migration, call invasion, cell migration, invasion, cell migration, invasion, coll migration and peptide multimer; and subject, a method of stimulating or inhibiting angiogenesis in a subject; a method of stimulating or inhibiting caleavage product or its peptide or peptide multimer; and effinity ligand useful for binding molecule, comprising the protypeptide, peptide or peptide multimer; and affinity ligand useful for binding molecule, comprising the polypeptide, peptide or peptide multimer; and a method of isolating molecule, comprising or carrier; and a method of isolating HPRG-binding molecule, comprising or carrier; and a method of isolating HPRG-binding molecule, comprising or carrier; and a method of isolating HPRG-binding molecule, comprising or carrier; and a method of isolating site or receptor, from a condisease or condition associated with undesired cell migration, invasing and method secule or condition as o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The antibodies are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invasion, proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzheimer's disease, barkinson's disease and amyotrophic lateral solenosis. The antibodies are stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunoassays

Sequence 525 AA;

mmunoassays

The present sequence is the protein sequence of human histidine proline rich glycoprotein (HPRG), a proteinaceous metal cheltor that can be used to inhibit angiogenis and treat cancer. Claimed anti-angiogenic to inhibit angiogenic coopidates the histidine-proline-rich (H/P) coopidates or peptides comprise: the histidine-proline-rich (H/P) coopidates or peptides comprise: the histidine-proline-rich (H/P) coopidates of the proliferation or endothelial tube formation in vitro or in vivo, or a pentapeptide having the generic sequence given in ABB79808. Coopidate multimers; a diagnostically protuced peptide multimers a diagnostically produced peptide multimer is diagnostically produced peptide composition. Comprising the diagnostically labeled antically peptide, peptide or peptide multimer; and antibody constitution or rabbit HPRG, and which binds to HPRG or to any of the domains in specific for an epitope of HPRG that is present in the H/P domain of specific for an epitope of HPRG that is present in the H/P domain in an antigen-binding fragment of the antibody; a method for the domains or an antigen-binding fragment of the antibody; a method for inhibiting coll invasion, or angiogenesis a method for treating a subject having a disease or condition associated with undesired cell migration, invasion, or angiogenesis is a method of stimulating or inhibiting and expression vector; transferded or beptide or peptide or peptide multimer; and efficitly ligand useful for binding to, or the peptide multimer; and affining to a cell, tissue or organ an angiogenesis-inhibitory amount of HPRG, an H/P domain of HPRG or its peptide in a biological sample; isolated collected or cells expressing the binding molecule, comprising the correction or angiogenesis in a subject and a method for insolating an ergopenial or cells expressing the binding molecule, cor respection or angiogenesing the binding molecule, comprising or cells expressing the binding steep or receptor, from a corrier; and expension or isolating and expension or angiog treating a disease or condition associated with undesired cell migration, invasion, proliferation, or angiogenesis, such as cancer, artheroscierosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzheimer's disease. Parkinson's disease, and amyotrophic lateral sclerosis. The antibodies are stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various migration, diagnosing or treating diseases associated with undesired cell migratio invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis. liver disorder.

```
The invention relates to a composition comprising several cDNAs that are differentially expressed in a liver disorder. The composition is useful coff tracting liver disorder such as hyperlipidaemia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of several molecules or compounds to identify a ligand which specifically binds a CDNA. A protein encoded by the CDNA is useful for high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the CDNA with several of molecules or compounds under conditions to allow specific protein which involves combining the protein encoded by the CDNA with several of molecules or compound, therefore identifying a ligand which specifically binds the protein. The compound, therefore identifying a ligand which specifically chinding perfect or compound, therefore identifying a ligand which specifically chinds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a cDNA differentially expressed in a

```
The present sequence is the protein sequence of the histidine-proline-rich (H/P) domain of rabbit anti-angiogenic histidine proline rich palycoprotein (HFRG, see also ABR79805). Claimed anti-angiogenic polypeptides or peptides comprise: the H/P domain (see ABB79806) of human HPRG; an H/P domain of rabbit HPRG; a variant of these that is capable of tunbiting angiogenesis, endothelial cell proliferation or endothelial tube formation in vitro or in vivo; or a pentapeptide having the generic sequence given in ABB79808. Also claimed are: chemically synthesised or trecombinantly produced peptide multimers a diagnostically or the rappended anti-angiogenic polypeptide, peptide or peptide multimer; a diagnostically useful HPRG-related composition, comprising the diagnostically labeled polypeptide, peptide or peptide multimer and a carrier; an antibody specific for an epitope of HPRG that is present in the H/P domain of human or rabbit HPRG, and which binds to HPRG or to any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or angiogenesis, e.g. cancer, atherosclerosis.

The present sequence is the protein sequence of the histidine-proline-
cc rich (HPMP) domain of human anti-anglogenic histidine proline rich
dyproprides or peptides comprises the HPM domain of human HPMP,
and of rabbit HPMPG, see ABB12345); a variant of these that is capable
cc domain of rabbit HPMPG (see ABB12345); a variant of these that is capable
cc dimibiting angiogenesis, endothelial cell proliferation or endothelial
cc finibiting angiogenesis, endothelial cell proliferation or endothelial
cc funbe formation in viero or in vivo; or a pentapeptide having the generic
cc the formation in ABB19808. Also claimed are: chemically synthesised or
recombinantly produced anti-angiogenic polypeptide, peptide or peptide
cc recombinantly labeled anti-angiogenic polypeptide, peptide or peptide
cmultimer; an antibody specific for an epitope of HPMP or peptide
cc arrier; an antibody specific for an epitope of HPMP or peptide
cc the Gomain of human or rabbit HPMC, and which binds to HPMC or to any
cc the Gomain of human or rabbit HPMC, and which binds to HPMC or to any
cc the Gomain of human or rabbit HPMC, and which binds to HPMC or to any
cc the Gomain of human or antiger-binding fragment of the antibody; a
method for inhibiting call migration, cell invasion, cell proliferation
cc transfected for inhibiting angiogenesis; a method of transfected cells angiogenesis; a method of angiogenesis, an authody
cc angiogenesis, or for inducing apoptosis; a method of angiogenesis and product or its peptide
cc stimulating or inhibition angiogenesis; a method of
cc angiogenesis. Inhibition and product or its peptide
cc the presence of HPMC or its cleavage product or its peptide
cc the prince or peptide multimer; an expression or calls expressing
cc the binding molecule, comprising the polypeptide, polypeptide, peptide or spelide or spelide sequence of the polypeptide
cc binding molecule, comprising the polypeptide, peptide or or peptide
compositions and method of sequence or peptide
cc sompositions are useful in diagnosing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      proliferation, or angiogenesis, such as cancer, atherosclerosis, diabetic retinopathy, inflammation, endometriosis, arthritis, peptic ulcers, or fractures. HPRG is especially useful in inhibiting the growth of primary tumours or metastases, and may also be used in treating neurodegenerative diseases like Alzheimer's or Parkinson's disease. The antibodies are
                                                                                      New histidine-proline rich glycoprotein (HPRG) polypeptide, useful for diagnosing or treating diseases associated with undesired cell migration, invasion, proliferation, or anglogenesis, e.g. cancer, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   stimulators of angiogenesis and are useful for promoting neovascularization in pertinent disease states, and in various

                                                                         ADD45442;
                ADD45442
                                     The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity responsible for genetic disorders or other traits to assess blodiversity and canno acid sequences. Abg00010-Abg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the will be printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               œ

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chart is differentially expressed in returnal tissue of a first animal that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in natural subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating to pain and a pharmaceutical composition compressing the one or more of the polypeptides given in the compound that in an animal of one or more of the polypeptides given in the compound that it is useful for preparing a medicament for treating pain and spared nerve injury (SNI) in an animal (e.g. spinal segmental nerve injury (SNI) in an animal (e.g. spinal segmental nerve injury (SNI) in an animal (e.g. spinal nerve injury (SNI) in an animal (e.g. spinal composition which is differentially expressed during pain. Note: the specification, but was obtained in electronic form directly from WIPO at specification, but was obtained in electronic form directly from WIPO at the polyment in the composition of the specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                                                                                                                                  ò
```

The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an open that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence subjected to pain, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially

pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of

us-10-074-225a-6.rag

expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymeldes, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain and appared nerve injury (cumy), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form mark of the printed specification, but was obtained in electronic form directly from WIPO at fig. wipo.int/pub/published_pct_sequences.

Claim 1; Page; 1017pp; English

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially respected in a manimal subjected to pain and a fixt to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in meuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that and a pharmaceutical composition compound useful in treating method for identifying a compound or feature that regulates the activity of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain (e.g. spinal segmental nerve injury (Cung), chronic construction composition compising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Cung), chronic construction continity (CCI) and sparad nerve injury (KNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: the specification, but was obtained in electronic form directly from MIPO at the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from wipo int/pub/published_pot_energe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   164 <u>gGPOGPPPPGGPQQSPPQGPPGGPQGPQGPPGBPPGGPQQGR----QGPPPPGGPQQDP</u> 219

The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence subjected to pain, a method for identifying a compound which regulates the expression of a polynuclectide sequence the expression of a polynuclectide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the
ORFI actually encodes the protein, N-75. The polypeptide encoded by ORFI is proline-rich and as such, prone to aberrent behaviour during SDS PAGE analysis as was found with the actual translation product. Also, a hybrid translation prod. contained no methionine residues; ORFI has only one whereas ORF2 has about 20 met codons. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                          Two open reading frames are present in the cDNA of the Enod2b genomic clone, ORF1 and ORF2 (AAR04118 and AAR04119 resp.) but it is thought that ORF1 actually encodes the protein, N-75. The polypeptide encoded by ORF1 is proline-rich and as such, prome to aberrent behaviour during SDS PAGE analysis as was found with the actual translation product. Also, a hybrid translation prod. contained no methionine residues; ORF1 has only one whereas ORF2 has about 20 met codons. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  115

polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Isolating ribonucleoprotein complex, by contacting RNA affinity substrate having ribonucleoprotein assembly sequence and affinity tag, with protein mixture, subjecting complex formed to chromatography, affinity selection.

Claim 24; Page; 39pp; English.

The invention relates to forming (MI) an isolated ribonucleoprotein (RNP) complex (C), involves contacting an RNA affinity substrate (S) comprising an RNP assembly sequence (AS) and an affinity tag, with a protein mixture

(GEST ) GENSET SA

```
to permit formation of (C) on AS, subjecting (C) to chromatographic separation, and subjecting (C) to affinity selection, where the affinity casparation, and subjecting (C) to affinity selection, where the affinity maltose binding protein binds to an affinity matrix. Also included are an isolated spliceosome preparation (isolated by (MI)), a RNA comprising can RNP complex binding site and at least one phage cost protein crooping they and least one phage cost protein complex binding site and at least one phage cost protein complexed by (MI) a subject having a disorder associated with abnormal RNP complexes (by cobtaining a sample of calls from a subject, purifying RNP complexes (by the cells of the subject by (MI), determining the presence in the complex bin the subject. (MI) is useful for forming an isolated RNP complex, an hurby complex, an mRNA export complex, or an H complex. (complex selected from a spliceosomal complex, or an H complex. (MI) is useful for treating a subject having a disorder associated with abnormal RNP complexes. (MI) is useful for treating a subject having a complex, an an end and an end of the subject is useful for treating a subject having a disorder associated with abnormal RNP complexes. (MI) is useful for treating a subject having a complex, an everse transcriptuse complex, a fragile X complex. The present sequence represents a known human spliceosome complex. The present sequence represents a known human spliceosome complex. The present sequence represents a known human spliceosome complex complex. The present sequence represents a known human spliceosome complex. The present sequence represents a known human spliceosome complexed the sequence is not shown in the sneed for the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      286 РGHGHSHPHPFPPPGGMPHPGMSQMQLAНHGPHGLGHPHAGPPGSGGQPPPRPPPGMPHPG 345

Disclosure; Page 166; 242pp; English.

The invention relates to human novel polynucleotide and polypeptide sequences useful as reagents in forensic analyses, as chromosome markers, as tissue/cell/organelle-ppecific markers, in producing expression vectors, or in screening and diagnostic assays. The invention is used as reagents in screening and diagnostic assays for abnormal novel expression and/or biological activity, and in screening compounds that may be used in the treatment of novel-related disorders, e.g. neurological disorders. The novel gene is also used in gene therapy. The present sequence is human cp3 salivary proline-rich protein splice variant (Saprip) fragment of the invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Description: PCR detection of a dinucleotide repeat in the human histidine-rich glycop
A; Reference number: S29669

A; Accession: 529669
A; Status: preliminary
A; Status: preliminary
A; Status: preliminary
A; Colecule type: DNA
A; Residues: 214-247
A; Coomment: Dreliminary
A; Coomment: Although its physiological function is not yet known, HRG does bind heme, dy:
C; Comment: Although its physiological function is not yet known, HRG does bind heme, dy:
din, and the lysine-binding site of plasminogen. On the basis of its homology with HWW }
lood coagulation cascade.
C; Comment: The amino half of this protein is homologous to the first two cystatin-like ould not have inhibitory activity.
C; Comment: In addition to having a high histidine and proline content, this protein has

Aymap position: 327-327
CySuperfamily: histidine-rich glycoprotein; cystatin homology
CySuperfamily: histidine-rich glycoprotein; cystatin homology
CySuperfamily: histidine-rich glycoprotein binding; tandem repeat
F;1-18/Domain: signal sequence #status predicted <813>
F;19-525/Product: histidine-rich glycoprotein #status predicted <MAT>
F;19-131/Domain: cystatin homology <CY1>
F;10-246/Domain: cystatin homology <CY2>
F;10-246/Domain: proline-rich
F;348-437/Region: histidine-rich
F;351-25,344,345/Binding site: carbohydrate (Asn) (covalent) #status predicted
F;78-89;105-126,218-241/Disulfide bonds: #status predicted C;Genetics: A;Gene: GDB:HRG A;Cross-references: GDB:120055; CMIM:142640 e-rich' region.

C,Comment: This protein contains six 18- to 19-residue repeats.
C,Comment: This protein may protect teeth by binding to tannins.
C,Superfamily: proline-rich protein
C,Reywords: duplication; parotid Gland; saliva; tandem repeat
F,11-13/Domain: signal sequence #status predicted <81G>
F,14-206/Product: acidic proline-rich protein #status predicted <MAT>
F,80-189/Region: 18-residue repeats

                                                                                                                                  coagulation cascade.
SUBCELULIAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma DOMAIN: In addition to having a high His and Pro content, this protein has many internal repeats. 12 tandem repetitions of a 5-residue sequence (GHHPH, consensus) form a histidine-rich region.
SIMILARITY: Contains 2 cystatin-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         275 КРРЕКРИGSRDHHHPHKP----НЕНФРРРРБВВВВВВРБРБРБРББРББРВ СSSCQH
FUNCTION: The physiological function is not yet known. It binds heme, dyes and divalent metal ions. It can inhibit rosette formation and is known to interact with hepatin, thrombospondin, and the lysine-binding site of plasminogen. On the basis of its homology with HWW kinlinogen, the His-rich region of this protein may mediate the contact activation phase of intrinsic blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (POTENTIAL).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
